

### Example 1

Calculate the enthalpy change for the reduction of  $\text{Fe}_2\text{O}_3$  by Cu to form Fe and  $\text{CuO}$

$$\Delta H_{\text{formation}}(\text{Fe}_2\text{O}_3) = -824.2 \text{ kJ mol}^{-1}$$

$$\Delta H_{\text{formation}}(\text{CuO}) = -157.3 \text{ kJ mol}^{-1}$$

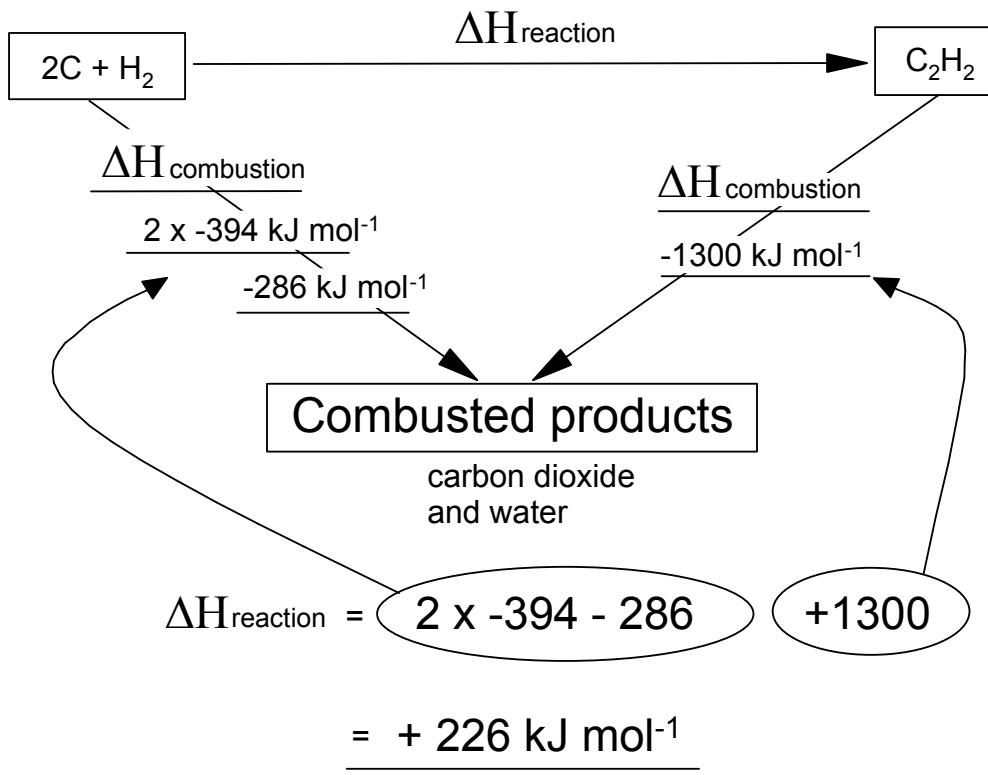

### Example 2

Calculate the enthalpy change for the reaction of carbon with hydrogen to form  $\text{C}_2\text{H}_2$ . What kind of enthalpy change is this?

$$\Delta H_{\text{combustion}} (\text{C}) = -394 \text{ kJ mol}^{-1}$$

$$\Delta H_{\text{combustion}} (\text{H}_2) = -286 \text{ kJ mol}^{-1}$$

$$\Delta H_{\text{combustion}} (\text{C}_2\text{H}_2) = -1300 \text{ kJ mol}^{-1}$$

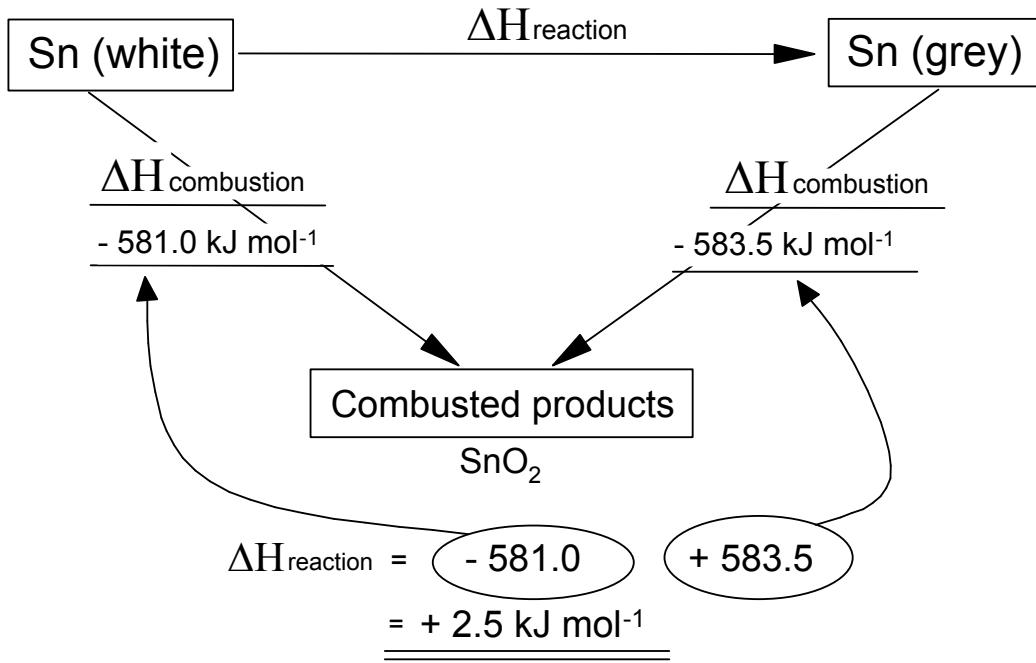

### Example 3

Calculate the enthalpy change for the change from white tin to grey tin.

$$\Delta H_{\text{combustion Sn (white)}} = -581.0 \text{ kJ mol}^{-1}$$

$$\Delta H_{\text{combustion Sn (grey)}} = -583.5 \text{ kJ mol}^{-1}$$

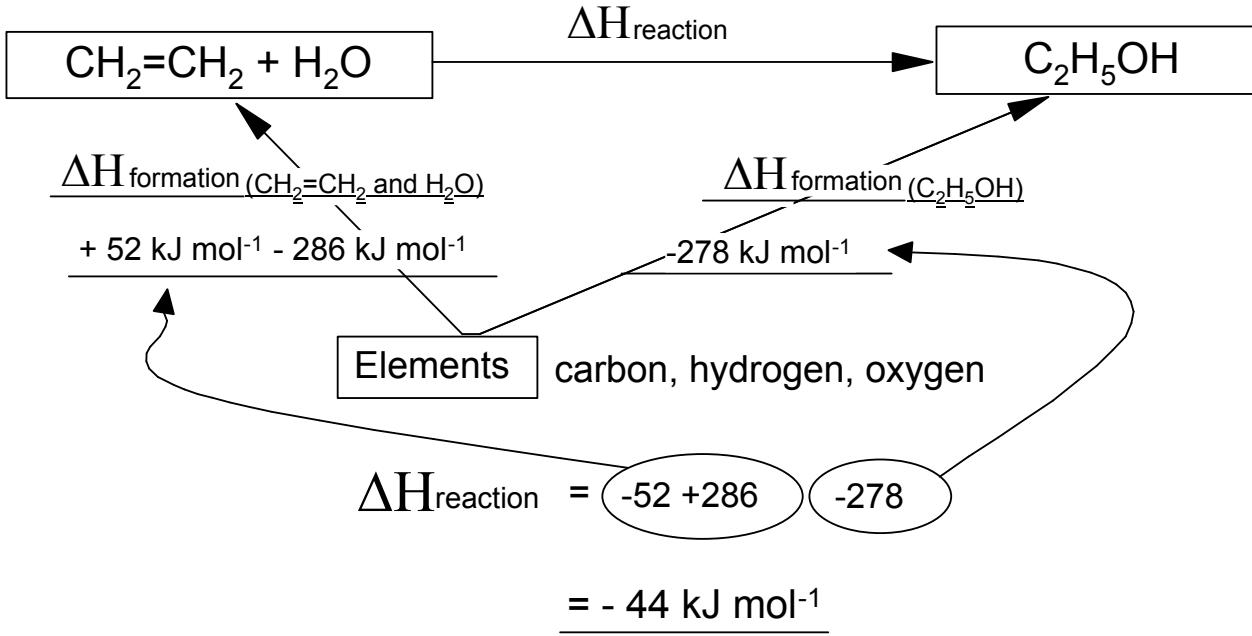

### Example 4

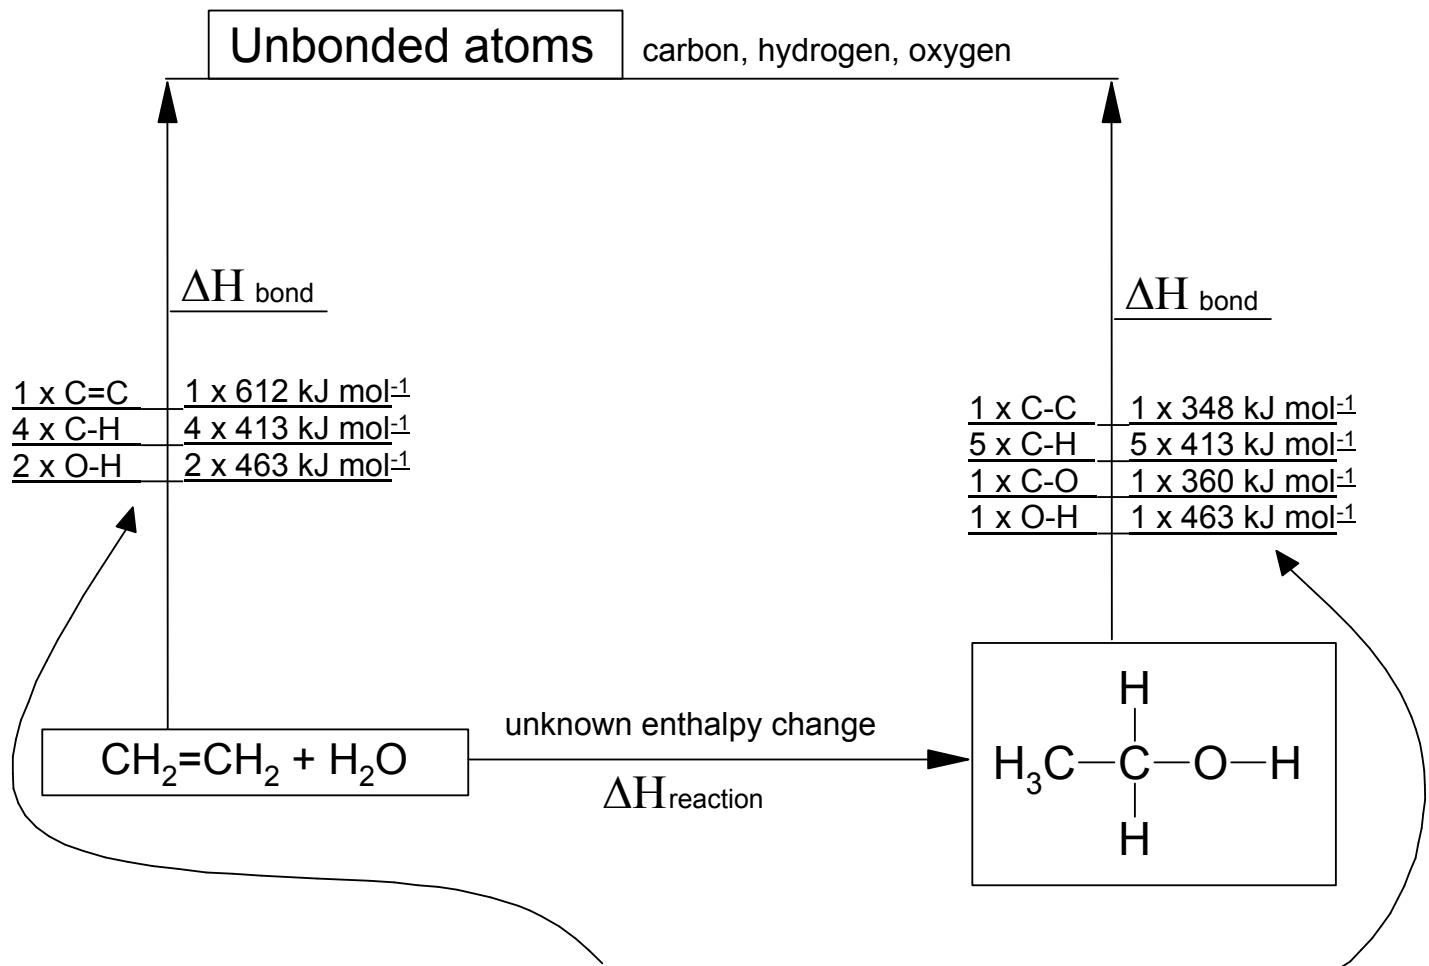

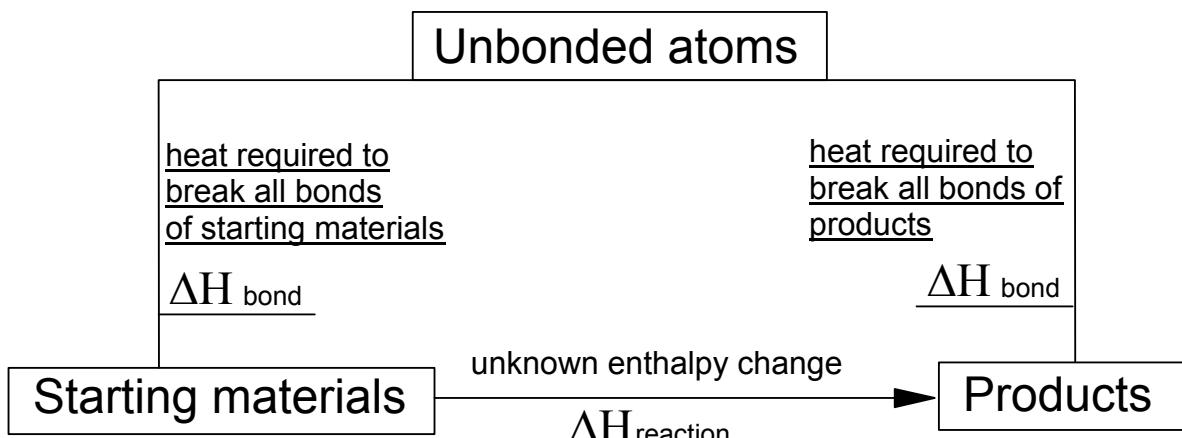

Calculate the enthalpy change for the reaction of ethene with water to form ethanol

$$\Delta H_{\text{formation (ethene)}} = +52 \text{ kJ mol}^{-1}$$

$$\Delta H_{\text{formation (water)}} = -286 \text{ kJ mol}^{-1}$$

$$\Delta H_{\text{formation (ethanol)}} = -278 \text{ kJ mol}^{-1}$$

$$\begin{aligned}
 \Delta H_{\text{reaction}} &= 1 \times 612 + 4 \times 413 + 2 \times 463 \\
 &\quad - (1 \times 348 + 5 \times 413 + 1 \times 360 + 1 \times 463) \\
 &= 3190 - 3236 \\
 &= \underline{-46 \text{ kJ mol}^{-1}}
 \end{aligned}$$
